Using R performs matrix com-putations, work with regression on the States Data. Take the States Data. Use the teacherpay as the Response variable and the Sat Math and Percentage as the Explanatory variable.

- (a) Compute the least-squares regression coefficients,  $\mathbf{b} = (\mathbf{X}'\mathbf{X})^{-1}\mathbf{X}'\mathbf{y}$ .
- (b) Calculate the estimated error variance,  $s_e^2 = e'e/(k-n-1)/(\text{where } e = y Xb)$ , and the estimated covariance matrix of the coefficients,  $V(\mathbf{b}) = s^2_{e}(\mathbf{X}'\mathbf{X})^{-1}$ .
- (c) Calculate the coefficient Standard Error for this model
- (d) Verify that the lm() model provides us with the same t and pvalues as the matrix formulation.
- (e) Create a 3d vector geometric representation for this data.

 $C_t$  $K_{t}$   $I_{t}$   $K_{t-1}$   $X_{t}$   $W_{t}^{(g)}$   $G_{t}$ Investment Capital stock (lagged 1 year) Equilibrium demand Government wages Government non-wage spending

Indirect business taxes and net exports

 $<sup>^{1}\</sup>mathrm{Many\;computer\;programs\;(for\;example,\;APL,\;Gauss,\;Lisp-Stat,\;Mathematica,\;R,\;S-PLUS,\;SAS/IML,\;and\;Stata)}$ include convenient facilities for matrix calculations.
